ABSTRACT:

PURPOSE: To obtain a composition for the oral cavity capable of suppressing coloring of teeth and sterilizing and removing microorganisms in the oral cavity and manifesting plaque controlling effects by blending a water-insoluble solid immobilizing an organosilicone quaternary ammonium therein with other ingredients.

CONSTITUTION: The objective composition for the oral cavity is obtained by including 0.001-50wt.% water-insoluble solid immobilizing an organosilicone quaternary ammonium therein as an active ingredient and further blending 0.01-60wt.% alcohol selected from ethanol, propanol and ispropanol for improving blending effects of the water-insoluble solid. This composition can be prepared into a dosage from such as tooth powder, a toothpaste, an ointment, a mouthwash, a pasta or a liniment. The organosilicone quaternary ammonium is applied to the water-insoluble solid (e.g. zeolite) by immersing or spraying, e.g. a solution of the organosilicone quaternary ammonium salt in a solvent according to a well-known method and immobilized by drying or heating.
